                                                                                                                                                                                                                                                                                  The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide in useful for detecting a PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO337
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated PRO polypeptide e.g. PRO200, PRO322, PRO540, PRO846 or PRO617 polypeptide, useful for treating sight loss due to retinitis pigmentosum by enhancing retinal neural cells survival.
                 Secreted

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a exteror comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993
                                                                                                                                                                                                     New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO4993 PRO337, useful in molecular biology, chromosome and gene mapping, generating antisense RNA and DNA, and in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07

CC polypeptide in a sample suspected of containing PRO4993 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO337 (CC "polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for detecting CC PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a consist of the toxin, radiolabel, or an antibody. The bioactive molecule to a cell expressing PRO337 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO4993 polypeptide; PRO725, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO4993 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO735, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO735, CC PRO700 or PRO739 polypeptide. PRO4993 polypeptide is useful for modulating at least one biological activity of the cell expressing PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, PRO700 or PRO739 polypeptide or an anti-PRO559 polypeptide; PRO725, PRO700 or PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide is useful for modulating the biological activity of the cell expressing PRO559 polypeptide; PRO725, PRO700 or PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide is useful for modulating the biological activity of the cell expressing PRO559 polypeptide; PRO735, PRO700 or PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO559 polypeptide. PRO559 polypeptide is useful for modulating the biological activity of the cell expressing PRO559 polypeptide. PRO559 polypeptide is useful for modulating the biologica
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ş

Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO 1 seed to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide is useful for detecting PRO493 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO493
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 auditory; tumour growth

peptide, a peptide).
           The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal
                                                                                                                         New PRO polypeptide useful fo

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell
                                                                                                                                   inflammation, organ failure, infertility, birth defects, syndrome, or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   29-APR-1998;

cc comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO contribody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO337 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO335 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO355 polypeptide. The bloactive molecule to a cell expressing PRO337 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO337 polypeptide is useful for linking a conscience of the cell. PRO337 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO499 polypeptide is useful for linking a conscience of the cell pro337 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO337 polypeptide; and PRO1559 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO499 polypeptide; and PRO1559 polypeptide is useful for linking a bloactive molecule for a cell expressing PRO337 polypeptide; and PRO1559 polypeptide is useful for modulating the cell expressing PRO337 polypeptide; and PRO1559 polypeptide is useful for polypeptide or anti-PRO337 polypeptide is useful for modulating the cell expressing PRO337 polypeptide is useful for modulating the polypeptide; pro4993 polypeptide is useful for modulating the polypeptide; pro725, polypeptide; and PRO1559 polypeptide or anti-PRO337 polypeptide or anti-PRO337 polypeptide or anti-PRO339 polypeptide; pro4993 polypeptide; pro4993 polypeptide; pro4993 polypeptide; pro4993 polypeptide; pro725, polypeptide; pro4993 polypeptide or anti-PRO337 polypeptide or anti-PRO359 polypeptide; pro725, pro700 or PRO739 polypeptide or anti-PRO359 polypeptide; pro4993 polypeptide; pro4993 polypeptide; pro725, pro700 or pro7939 polypeptide or anti-PRO359 polypeptide; pro725, pro700 or pro7939 polypeptide or anti-PRO359 polypeptide. The cell expressing PRO359 polypeptide. The col

Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimacric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide.
                                                                                                                                                                                                                                                            16-OCT-2001;

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence ident to an amino acid sequence chosen from 94 fully defined sequences as in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated sepeptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cel comprising the vector and producing PRO, a chimaeric molecule compris
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ferrara

New nucleic acid encoded a secreted and transmembrane polypeptide, useful for treating e.g. lung or breast tumors, osteoarthritis, rheumatoid arthritis, obesity, diabetes, hyperinsulinemia, hypoinsulinemia or

Example 114; SEQ ID NO 573; 456pp; English.

The invention relates to an isolated PRO polypeptide (secreted or CC transmembrane protein) having at least 80% amino acid sequence identity con an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal control of the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins comprising the vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising comprising the vector and producing PRO, a chimaeric molecule comprising pRO lacking its associated signal producing pRO, a chimaeric molecule comprising comprising producing pRO, a chimaeric molecule comprising pRO lacking a producing a pRO lacking a producing a pRO lacking a producing a producing a pRO lacking a producing producing a producing a producing a producing producing a produci

polypeptides PRO200, PRO322, PRO540, PRO846 and the survival/proliferation of rod photoreceptor gretinal disorders or injuries e.g., sight loss d PRO617 that r cells, useful in mammals. for

Example 114; SEQ Ħ ŏ 573; 464pp; English.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as give in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal signal given

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide in a sample suspected of containing PRO4939 polypeptide. 9RO493 polypeptide is useful for detecting PRO337 polypeptide. 9RO4933 polypeptide is useful for detecting PRO337 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Kljavin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cel comprising the vector and producing PRO, a chimaeric molecule comprising the vector and producing encoded acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide in a sample suspected of containing PRO4933 polypeptide is useful for detecting PRO4933 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New secreted and transmembrane PRO nucleic acid, for use in gene therapy, as a molecular weight marker for protein electrophoresis, as a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC PRO1559 polypeptide, and PRO1559 polypeptide is useful for detecting CC PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a CC bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule CC causes death of the cell. PRO337 polypeptide is useful for linking a CC bioactive molecule to a cell expressing PRO4939 polypeptide; PRO725, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule CC useful for linking a bioactive molecule to a cell expressing PRO4939 polypeptide; PRO4937 CC polypeptide is useful for modulating at least one biological activity of the cell expressing PRO337 CC polypeptide or anti-PRO4939 polypeptide is useful for modulating the cell expressing PRO337 CC polypeptide or anti-PRO4939 polypeptide; PRO7037 CC polypeptide or anti-PRO4939 polypeptide; PRO7037 CC polypeptide or anti-PRO4939 polypeptide; PRO725, CC polypeptide; pro4939 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, CC modulating the biological activity of the cell expressing PRO4939 polypeptide; PRO725, CC modulating the biological activity of the cell expressing PRO1559 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide; PRO700 or PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide; PRO705, CC modulating the biological activity of the cell expressing PRO1559 polypeptide; PRO700 or anti-PRO739 polypeptide; PRO700 or anti-PRO735, anti-PRO700 or anti-PRO739 polypeptide; PRO700 or anti-PRO739 polypeptide; PRO700 or anti-PRO700 or ant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide.
New genes and encoded secreted and transmembrane polypeptides, treating e.g. lung or breast tumors, osteoarthritis, rheumatoid arthritis, obesity, diabetes, hyperinsulinemia, hypoinsulinemia
                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ss; PCR; secreted protein; transmembrane protein; PRO; cytostatic; ophthalmological; antiarthritic; osteopathic; antirheumatic; vulnerary; auditory; tumour growth; retinal disorder; sporter-related joint problem; articular cartilage defects; osteoarthritis; rheumatoid arthritis;

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 hully defined sequences as given in the specification (including pRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO flued to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO4937
                                                                                                                                                                                                                                                                                                                                            Ferrara

CC in the specification (including PRO lacking its associated signal copeptide, a PRO extracellular domain with or without its associated signal copeptide). Also included are nucleic acids encoding the PRO proteins comprising the vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising CC pRO fused to a heterologous maino acid sequence, and an anti-PRO cantibody. PRO37 polypeptide is useful for detecting a PRO499 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO37 compressing PRO4993 polypeptide is useful for detecting PRO37 complexitive molecule to a cell expressing PRO499 polypeptide. The bioactive molecule to a cell expressing PRO499 polypeptide is useful for linking a complexitive molecule to a cell expressing PRO499 polypeptide is useful for linking a complexitive molecule to a cell expressing PRO499 polypeptide; and PRO499 polypeptide; pRO725, PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO499 polypeptide; pRO725, complexities are useful for linking a bioactive molecule con a cell expressing PRO499 polypeptide; pRO725, complexities or pRO739 polypeptide are useful for linking a bioactive molecule con a cell expressing PRO379 polypeptide or anti-PRO725, complexities or pro739 polypeptide; pRO4999 polypeptide or anti-PRO379 polypeptide promatorial expressing PRO725, complexities or pro739 polypeptide; pRO379 polypeptide or anti-PRO379 polypeptide; pRO379

                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide in useful for detecting a PRO4993 polypeptide is useful for detecting a PRO4993 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               weight m

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide. Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide in a sample suspected of containing PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting a PRO4993 polypeptide.

The invention relates to an isolated PRO polypeptide (secreted or CC transmembrane protein) having at least 80% amino acid sequence identity CC to an amino acid sequence chosen from 94 fully defined sequences as given cin the specification (including PRO lacking its associated signal CC peptide, a PRO extracellular domain with or without its associated signal CC peptide, a PRO extracellular domain with or without its associated signal CC mentioned above, a vector comprising a PRO nucleic acid), a host cell CC comprising the vector and producing PRO, a chimaeric molecule comprising CC PRO fused to a heterologous amino acid sequence, and an anti-PRO CC antibody. PRO337 polypeptide is useful for detecting PRO4993 polypeptide in a sample suspected of containing PRO4993 polypeptide. CC Similarly, PRO4993 polypeptide is useful for detecting PRO317 polypeptide, and PRO1559 polypeptide is useful for detecting PRO715, PRO700 or PRO739 polypeptide is useful for detecting CC PRO705, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a CC PRO705, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a CC causes death of the cell expressing PRO337 polypeptide; PRO725, CC pRO700 or PRO739 polypeptide are useful for linking a bioactive molecule coactive molecule to a cell expressing PRO493 polypeptide; PRO725, CC pro700 or PRO739 polypeptide are useful for linking a bioactive molecule coactive molecule to a cell expressing PRO337 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide is useful for modulating the cell expressing PRO339 polypeptide; PRO725, CC pro700 or PRO739 polypeptide. PRO493 polypeptide is useful for modulating the cell expressing PRO337 polypeptide; PRO725, CC polypeptide is useful for modulating the profical activity of the cell expressing PRO493 polypeptide; PRO725, CC polypeptide or anti-PRO4933 polypeptide; PRO725, CC polypeptide is useful for modulating the profical activity of the cell expressing PRO493 polypeptide; PRO725, CC polypeptide; PRO72
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      15-APR-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polypeptide; and PRO1559 polypeptide or anti-PRO725, anti-PRO700 or ant PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, PRO700 or PRO739 polypeptide. The polypeptides are useful for inhibiting tumour growth, retinal disorders sports-related joint problems, articular cartilage defects, osteoarthritis or rheumatoid arthritis, wound healing and hearing loss mammals. The present sequence is a Tagman PCR probe used investigate PR gene amplification in certain tumour cell lines.

```

-MAY-1998

```
The invention relates to an isolated PRO polypeptide (secreted or CC transmembrane protein) having at least 80% amino acid sequence identity CC to an amino acid sequence chosen from 94 fully defined sequence identity CC mennion and social sequence identity con in the specification (including PRO lacking its associated signal coppitie). Also included are nucleic acids encoding the PRO proteins comprising the vector comprising a PRO nucleic acid). A bost cell comprising the vector and producing PRO, a chimaeric molecule comprising CC pRO fused to a heterologous amino acid sequence, and an anti-PRO CC antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide. PRO7959 polypeptide is useful for detecting PRO3359 polypeptide. PRO7959 polypeptide is useful for detecting PRO3359 polypeptide. PRO7959 polypeptide is useful for detecting PRO337 polypeptide. PRO7959 polypeptide is useful for linking a cell expressing PRO337 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO337 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO3939 polypeptide; and PRO3939 polypeptide are useful for linking a bloactive molecule to a cell expressing PRO3937 polypeptide; and PRO3939 polypeptide; and PRO3939 polypeptide; and PRO3939 polypeptide; pRO7956, cell expressing PRO3939 polypeptide; pRO7956, cell expressing PRO3939 polypeptide; pRO3939 polypeptide

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide in a sample suspected of containing PRO4993 polypeptide.
                                                                                                                                                                                                                                                                                                                     Kljavin

CC Similarly, PRO4993 polypeptide is useful for detecting PRO337 CC polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO1559 polypeptide, and PRO1559 polypeptide is useful for detecting CC PRO725, PRO700 or PRO739. PRO4939 polypeptide is useful for Inking a CC bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule causes death of the cell. PRO337 polypeptide is useful for linking a CC pro700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide; PRO725, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO725, CC polypeptide is useful for modulating at least one biological activity of the cell expressing PRO337 polypeptide or anti-PRO493 polypeptide is useful for modulating the cell expressing PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, CC polypeptide or anti-PRO493 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, pro700 or PRO739 polypeptide or an anti-PRO799 polypeptide; PRO725, polypeptide; and PRO359 polypeptide or anti-PRO725, anti-PRO790 or anti-PRO799 polypeptide; pro790 or anti-PRO799 polypeptide; pro790 or anti-PRO799 polypeptide; pro790 or anti-PRO799 polypeptide. The cell expressing PRO790 or anti-PRO799 polypeptide. The prosent seguence is a Tagman PCR probe used investigate PRO cc mammals. The present sequence is a Tagman PCR probe used investigate PRO cc gene amplification in certain tumour cell lines.

The invention transmembrane

relates to an isolated PRO polypeptide (secreted protein) having at least 80% amino acid sequence

or identity

Example 114; SEQ ID

ö

573; 464pp; English

and

are useful

and polypeptides, used as molecular weight in chromosome mapping and tissue typing and

ij

polynucleotides

RESULT 2317 ABV80977 cc in the specification (including PRO lacking its associated signal cc in the specification (including PRO lacking its associated signal competide, a PRO extracellular domain with or without its associated signal competide. Also included are nucleic acids encoding the PRO proteins comprising the vector and producing PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising CC PRO fused to a heterologous amino acid sequence, and an anti-PRO polypeptide. PRO137 polypeptide is useful for detecting a PRO493 polypeptide. Similarly, PRO493 polypeptide is useful for detecting PRO493 polypeptide. CC polypeptide, PRO725, PRO700 or PRO739. PRO493 polypeptide is useful for detecting PRO375 polypeptide is useful for detecting PRO725, PRO700 or PRO739. PRO493 polypeptide is useful for detecting CC PRO725, PRO700 or PRO739. PRO493 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide. CC causes death of the cell. PRO337 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO725, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide; PRO725, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO725, CC polypeptide is useful for modulating at least one biological activity of the cell expressing PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO339 polypeptide is useful for modulating the biological activity of the cell expressing PRO325, PRO725, PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, PRO739 polypeptide is useful for collaborative problems, articular call expressing PRO725, anti-PRO739 polypeptide; useful for inhibiting thmour growth, retinal disorders, constructed amount of the cell expressing lactivity of of the cell expressing PRO725, anti-PRO730 or PRO739 polypeptide. The collaboration in certain tumour ce á 밁 Query Match Best Local S Matches 15 30-JAN-2001; 30-JAN-2001; 30-JAN-2001; Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to human testis expressed Patched like protein (HTPPL, see ABV8759 to ABV78762 and ABB98519 to ABB9850). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stopy codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or activity of human focation to the disorder of colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an examine from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

Autoimmune diseases include Addison's diseases arrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leakaemias, lymphomas and cancers such as cancer of the brain, season as the season of the brain, season as the season of the brain, season as the season of the brain, season of the brain of the b

The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

The methods and kits of the invention are used for screening individuals, families and populations for disease conditions or predispositions for the development of a disease condition which is characterised, exacerbated or associated with Th/Th2 dysregulation in a mammal. They are used to treat, prevent or diagnose autoimmune diseases such as IDDM (Insulin dependant diabetes mellitus). The present DNA sequence is mammalian IL-12 p40 intron 2 allelic variant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           deoxyadenine"
```

may be carried out without subjecting the test specimen to harsh conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso (nucleotides have the 3' positions of xylose sugars linked via the o-xylene ring). Two nucleotides are coupled through a xylene residue to form the dimer synthon. This additional modifications may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)

pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human leukocyte adhesion protein p150, 95 alpha subunit gene (HUMINTO2) beginning at nucleotide 2370 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV; HER; HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays

The synthetic oligomer is capable of forming a triplex at physiological

                                                                              Sequence
                                                                                                   Revised record
                                                                                                                      The present invention relates to human oligonucleotides comprising a single nucleotide polymorphic site (SNP: AAH88797-AAH89219). The present sequence is one such oligonucleotide. The oligonucleotide can be used foremaics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                                                                                                                   Claim 68; Page 11; 43pp; English.
                                                                                                                                                                                                                      New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly disease, and also in forensics and paternity testing.
                                                                                                                                                                                                                                                                     WPI; 2001-335945/35.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes the isolation of novel human polynucleotides encoding glypican-related proteins, glypican-6 (GPC6) and glypican-4 (GPC4). The invention also describes the polynucleotide and encoded protein sequences of glypican-1 (GPC1), glypican-3 (GPC3) and glypican-5 (GPC5). The products of the invention can be used to diagnose and treat disorders and diseases, particularly those involving abnormal cell growth and behaviour, such as somatic overgrowth and tumour formation. AAZ00551-200554 represent primers used in 5'-RACE (rapid amplification of cDNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 25 BP; 5 A; 8 C; 5 G; 7 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Glypican; GPC1; GPC3; GPC4; GPC5; GPC6; human; glypican-related protein; glypican-6; glypican-4; glypican-1; glypican-3; glypican-5; diagnosis; treatment; abnormal; cell growth; cell behaviour; seomatic overgrowth; tumour formation; RACE; rapid amplification of cDNA ends; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                              CC The present invention describes a nucleic acid segment of 10-100 CC contiguous bases chosen from one of 632 fragments (AAA78631 to AAA79262), CC where the segment comprises a polymorphic site or an immediately adjacent base, or the complement of the segment. Also described are: (1) an allele CC -specific oligonucleotide that hybridises to a segment of the novelty; (2) an isolated nucleic acid comprising a sequence of the novelty where the polymorphic site within the sequence is occupied by a base other than CC the reference base indicated in the specification; and (3) analysing a classe occupying any one of the polymorphic sites of the novelty. The nucleic acid segments and method can be used to analyse an CC individuals nucleic acid segments and method can be used to analyse an CC individuals nucleic acid segments and method can be used to are useful for, e.g. forensics, paternity testing, CC correlation of polymorphisms with phenotypic traits and for genetic caps of human genomic DNA fragments containing polymorphic sites. The base occupying the polymorphic site is indicated using IUPAC-IUB
                                                                                                                                                                                                                                                              RESULT
                                                                                                                                                                                                                                                                                                                                                                            Best Local Similarity

                                                                                                                                                                                  The invention describes an isolated polypeptide segment (I) whose genes CC are fat regulated. (I) or the polymucleotide encoding it (II) are useful CC for diagnosing the presence of or a predisposition for a disorder CC involving fatty acid regulated genes in a subject. A composition CC containing (I) or (II) is useful for treating a disorder involving fatty CC acid regulated genes, where the disorder is selected from a CC golyunsaturated fatty acid (PUPA) disorder, eczema, cardiovascular CC disorders (such as hypertriglyceridaemia, dyslipidaemia, atherosclerosis, CC coronary artery disease, cerebrovascular disease or peripheral vascular CC disease), inflammation (such as sinusitis, asthma, pancreatitis, costeoarthritis, rheumatoid arthritis or acne), body weight disorders (Such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as obesity, cachexia or anorexia), psychiatric disorders, cancer, CC (such as observe, cachexia or anorexia), psychiatric disorders, cancer, CC (such as observe, cachexia or anorexia), psychiatric disorders

                                                       03-MAY-2001
                                                                                                                                                                                                                                                                                                                                                                                                        sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as contact with allergens that lead to allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           including autoimmune diseases, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious diseases and neoplastic diseases Autoimune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases
                                                                                         AAC80151;
                                                                                                                          AAC80151 standard;
                                                                                                                                                                                                                                                                                                                                                            Sequence 22
                                                                                                                                                                                                                                                                                                                                                                                           such as leukaemias, lymphomas and cancers such as cancer of the brain breast. The present sequence represents a Vbeta gene repeat sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles. The method is useful for subtyping or typing of HLA class 1 alleles. The present sequence is an amplification primer used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Locus-specific, separate amplification of exon 2, exon 3, and/or exon of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using defi primer sets, useful for subtyping or typing of HLA Class I alleles.

                                                                                                                                           Identifying extendible primers for use in identification, or classification of a nucleic acid of an organism, allele or gene such a class 1/2 HLA comprises identifying all possible nucleotide sequences specific length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to loblolly pine polynucleotides with one or more Simple Sequence Repeats (SSRs) (see AAA74205-A74322). The present sequence is one such SSR repeat. SSRs are also known as microsatellite DNA repeats. The SSRs are useful as genetic markers for genetic mapping, population genetics studies and inheritance studies in various plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polynucleotide having simple sequence repeat useful as markers in plants for genetic characterization e.g. genetic mapping study, an inheritance study of a commercially important trait in a plant breeding program.

Claim 14; Page 37; vvrr, -_.

The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein classification of genes. This can then be used to predict protein the sequence and structure, in organ donation to match the organ with the sequence and structure, in organ donation to match the organ with the sequence and structure, in organ donation to match the organ with the sequence and structure, in organ donation to match the organ with the sequence and structure, in organ donation to match the organ with the sequence and structure.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                         The present invention relates to human testis expressed Patched like protein (HTPL, see ABVB759 to ABV78762 and ABB9519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stopy codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                          The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

CL Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acids to at least two or more nucleic acids for analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in southern, Northern or dot-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 25 BP; 5 A; 13 C; 6
                                               blot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer excensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New array of nucleic acid probes, useful for Southern, Northern or dot-blot hybridization sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human microarray DNA oligonucleotide SEQ

cissue. A method (M2) for increasing seed yield or biomass of a plant growing under one or more environmentally adverse conditions or low nitrogen, by transforming a plant with TG in operative linkage with a btg 26 promoter element to produce a transformed plant, TG encoding an enzyme involved in nitrogen assimilation or metabolism and growing the transformed plant is also provided. (M1) is useful for directing tissuespecific expression of a target gene encoding proteins involved in phytoremediation, pesticide, herbicide resistance, resistance to stress, phytoremediation, pharmaceutical proteins or enzymes which produce pharmaceutical compounds, nutrient uptake or utilization, plant growth, proteins which alter nutrient content or proteins involved in appearance of the later of the proteins of the proteins of the parameter of the proteins of the prot
                                                                                                             of the plant, resistance to insects, nematodes, viruses, bacteria or fungi, appearance or antisense genetic sequences, within a fruit, seed, flower, tuber, shoot, vascular system, meristem, pollen or ovule of a plant. (M2) is useful for increasing biomass of a plant growing under one or more environmentally adverse conditions such as salinity, nutrient, drought, temperature, oxygen, heavy metal, pH stress or their combinations. The present sequence represents a fragment of the btg-26
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  environmentally or developmentally-regulated expression of a target gene (TG) in a plant. The method involves producing a plant from a transformed plant cell comprising TG in operative linkage with a genetic regulatory element, especially Brassica turgor gene-26 (btg-26) promoter element, which directs tissue-specific expression of TG within selected plant which directs tissue-specific expression of TG within selected plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Directing tissue-specific expression of a target gene in a plant, using a genetic construct comprising a target gene in operative association with Brassica turgor gene-26 promoter element.

The oligonucleotides (ONs) are targeted to either coding region. The oligonucleotides (ONs) are untranslated region (UTR) mENA encoding human c-raf. The ONs may be phosphorothioate linked and may contain modifications at the 2' position of the sugar modety. ONs are pref. complementary to either 3' or 5' UTRs, phosphorothioate linked and contain 2'-O-alkyl sugar modifications. The ONs are used to inhibit expression of human raf in partic. in conditions associated with hyperproliferation e.g. cancer, restenosis, and psoriasis

or phosphorochioate linkages, comprising a first subsequence having 2'-O-CH2-CH2-O-CH3 sugar moieties and a second subsequence having 2'-deoxy sugar moieties. (A), which has RNaseH activity for cleaving a '-deoxy sugar moieties. (A), which has RNaseH activity for cleaving a complementary strand, can be used to modulate the expression of ras, raf and protein kinase C genes, useful in the therapy of AIDS, atherosclerosis, bacterial or other infections, or to control aberrant cell growth in humans, animals or plants. (A) can also be used diagnostically, particularly when labelled, to detect overexpression of mRNA or expression of abnormal RNA, including imaging of tissue sections, and as a research reagent. (A) has increased binding affinity for complementary strands (attributable to the 2'-O-CH2-CH2-O-CH3 sugar moiety, which overcomes the loss of affinity caused by altered intersugar links), and increased resistance to nuclease (from the modified links and the 2'-O-CH2-CH2-O-CH3 sugar moiety)
                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is an example of an oligonucleotide of the invention, and is an inhibitor of c-raf expression. The invention relates to oligonucleotides (A), which specifically hybridises to RNA or DNA, comprises a linear sequence of nucleotide units linked by phosphodiester
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oligo:nucleotide with RNaseH activity, which specifically hybridises to DNA or RNA - comprises 1st and 2nd sub:sequence(s) having 2'-O-CH2-CH2-O-CH3 and 2'-deoxy sugar moieties, useful for therapy or diagnosis.

Compositions containing the oligonucleotides entrapped in sterically stabilised liposomes are claimed. The compsns. can be used for inhibiting the expression of human raf. They can be used for the treatment of mammalian cancer, partic. human cancer e.g. lung, stomach, renal, breast, laryngeal, pancreatic, colorectal cancer and malignant melanoma. In particular the compsns. can inhibit abnormal raf expression and retain anti-hyperproliferative activity after prolonged circulation in the bloodstream. They facilitate the reduction of accumulation of ONs in non-target organs and a reduction of acute and chronic side effects during prolonged treatment. ON18, 19 and 21 are chimeric oligonucleotides with uniform phosphorochioate backbones, and substituted with methoxy at the compsns of circle sugar moiety as indicated above. ON21 is targeted to
                                                                                                                                                                                                                                                      Cancer; anionic polysaccharide; human; renal cancer; breast cancer; laryngeal colorectal cancer; malignant melanoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting human raf expression, poligonucleotide targetted to mRNA sterically stabilised liposome(s).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               comprise covalently-bound nucleosides that individually include a ribose or deoxyribose sugar portion and base portion where the nucleosides are joined together by internucleoside linkages such that the base portion of the nucleosides form a mixed base sequence that is complementary to a RNA base sequence or to a DNA base sequence. At least one of the nucleosides has a modified ribofuranceyl molety bearing a 2'-aminoalkoxy or 2'-finidazolylalkoxy substituent. The nuclease resistant compounds can be used for modulating the activity of DNA or RNA. They can be used for treating organisms having a disease characterised by the undesired production of a protein. Diverse organisms such as bacteria, yeast, protozoa, algae, plant and higher animal forms including warm-blooded animals can be treated in this manner. The compounds can be used for treating e.g. AIDS, atherosclerosis or trenours. They can also be used in diagnostic methods for detecting the presence or absence of abnormal RNA molecules, or abnormal or inappropriate expression of normal RNA field.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

13-AUG-1990;
12-AUG-1991;
The invention relates to a nuclease resistant compound that hybridises with RNA or DNA. The compound comprises covalently-bound nucleosides that individually include a ribose or deoxyribose sugar portion and a base portion, where the nucleosides are joined together by internucleoside linkages such that the base portion of the nucleosides form a mixed base sequence that is complementary to a RNA base sequence or to a DNA base sequence; and where at least 1 of the nucleosides includes a modified deoxyfuranosyl moiety bearing a 2'-substituent selected from cyano,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention provides antisense oligonucleotides targeted to mRNA encoding human raf and capable of inhibiting raf expression. The antisense oligonucleotides are useful for treating and diagnosing abnormal proliferative states and hyperproliferation (e.g. cancer, psoriasis, or blood vessel restences), and inhibiting raf expression. Sequences ARZ1511-537 and ARZ11553-573 represent antisense oligonucleotides for human c-raf kinase
                                                                                                                                                                   Nuclease resistant oligonucleotide analogues - having nucleosides including modified deoxyfuranosyl moiety bearing 2'-substituent to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           fluoromethyl, thioalkoxyl, alkylsulphinyl, alkylsulphonyl, allyloxy and alkeneoxy groups. The nuclease resistant oilgonucleotides (ONs) can bind to and modulate the activity of DNA or RNA and can be used for treating organisms having a disease characterised by the undesired production of a protein. They can be used in therappeutic or prophylactic treatment in organisms such as bacteria, yeast, protein, algae, plant and higher animal forms including warm-blooded animals. The ONs can also be used for treating infections, AIDS, atherosclerosis or tumours. The products can be used for detection and diagnosis. The ONs provide enhanced binding to targets. Increased binding of 2'-sugar modified sequence-specific ONs provides superior potency and specificity compared to phosphorus-modified ONs. The present sequence represents a chimeric antisense oligo for c-raf
PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAZ36734-X37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as mongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic.
Chlamydia trachomatis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepat nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.

                                                                                                                      The present sequence represents a phosphorothioate antisense oligonucleotide used to inhibit c-raf gene expression. The oligonucleotide used to inhibit c-raf gene expression. The oligonucleotide used to indistinct or the second part has at least two consecutive 2'-F(2'-H) nucleotides and the second part has at least five consecutive nucleotides with 2'-H sugar moieties. The modified oligonucleotide has increased nuclease resistance, and increased binding affinity for substrates. The oligonucleotide elicits RNase H strand cleavage of specific RNAs. Oligonucleotides of the invention are useful for the diagnosis, detection and treatment of conditions susceptible to oligonucleotide therapeutics (e.g. AIDS and atherosclerosis). (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotides eliciting RNAase H activity useful for diagnosis treatment of diseases e.g AIDS or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense oligonucleotide; RNAse H strand cleavage; pl AIDS; atherosclerosis; ss.

                                                                                                                      CC comprising 2.-fluoro modified ribofuranosyl nucleotides. (I) comprise CC covalently bound nucleotides, where the nucleotides are joined together by: (a) internucleotide linkages such that the base portion of the CC nucleotides forms a mixed base sequence; and (b) at least one of the CC nucleotides includes a modified ribofuranosyl group bearing a 2.-fluoro CC substituent; provided that at least two of the nucleotides are 2.-fluoro CC modified ribofuranosyl nucleotides when the internucleotide linkages are CP phosphodiester nucleotides. (I) bind to their target mRNA and inhibit its CC expression. (I) are resistant to nuclease degradation and hybridise with CC appropriate strength and fidelity to its target mRNA and inhibit its CC expression. (I) may be used to freat acherosclerosis following CC useful as research agents, diagnostic agents and as oligonucleotide CC therapeutics. (I) may be used to treat acherosclerosis following CC angioplasty to prevent reocclusion of the treated arteries. (I) may also be used to modulate the expression of RAF gene, a cellular gene whose CC used to modulate the expression of RAF gene, a cellular gene whose CC activate form has been implicated in abnormal cell proliferation and CC tumour formation. (I) are also used to modulate the expression of protein CC kinase C. (I) exhibit hybridisation properties of higher quality than phosphorous modified oligonucleotide duplexes containing CC methylphosphonates, phosphoramidates and phosphate triesters. The present consequence represent an oligonucleotide used in the exemplification of the

                                                                                                                                                                 c-raf is a serine-threonine-specific protein kinase and is thought to play a fundamental role in signal transduction, and cell proliferation control. The present sequence is an antisense oligonucleotide. This sequence is targeted to human c-raf gene, resulting in c-raf expression inhibition. The present sequence may be useful for treating and rafassociated cell hyperproliferation conditions such as cancer, hyperplasias, pulmonary fibrosis, angiogenesis, psoriasis, atherosclerosis and smooth muscle cell proliferation in blood vessels e.g. stenosis or restenosis following angioplasty. Also, the present sequence may be useful for treating inflammatory disorders such as tissue graft rejection, endotoxin shock and glomerular nephritis
                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 31; Col 10; 31pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense oligonucleotides targeted to nucleic acid molecule encoding human raf useful for diagnosis, treatment of raf-associated cell proliferative conditions such as cancer, psoriasis or blood vessel

                                                                                                                The present invention relates to novel antisense oligonucleotides which are targetted to nucleic acids encoding human raf proteins and capable (inhibiting raf expression. The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferating cells with a therapeutically effective amount of an oligonucleotide of the invention. The method is useful for treating cancer, angiogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is an angiogenesis or neovascularisation.
                                                                                                                                                                                                                                                     Treating cancer, angiogenesis or neovascularization by administering antisense oligonucleotides targeted to human raf sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  therapy; cancer; cytostatic; anti-angiogenic; vascular; antisense; phosphorothioate backbone; c-raf kinase; ss.

 12-AUG-1991;
24-DEC-1991;
05-MAR-1992;
01-JUL-1992;
                            organism with a disease associated with the undesired production of a protein, e.g. bacterial, viral or protozoan infections, AIDS, abnormal cell proliferation and tumour formation, or atherosclerosis. The press sequence represents the human c-raf mRNA antisense oligonucleotide #7
                                                                                    with RNA or DNA, comprising covalently-bound nucleosides that individually include a ribose of deoxyribose sugar portion and a base portion. The nuclease resistant compounds are useful as therapeutics, diagnostic agents, or research reagents. The compounds are also useful for modulating the activity of an RNA or DNA molecule, or for treating the activity of an RNA or DNA molecule, or for treating the activity of an RNA or DNA molecule, or for treating the activity of an RNA or DNA molecule, or for treating the activity of an RNA or DNA molecule, or for treating the activity of an RNA or DNA molecule, or for treating the activity of an RNA or DNA molecule, or for treating the activity of an RNA or DNA molecule, or for treating the activity of an RNA or DNA molecule.
                                                                                                                                                                                                                                                                                                                                          Cook
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key

 The invention relates to a modified oligonuclectide comprising several covalently bound nucleosides including a ribose or deoxyribose sugar covalently bound nucleosides including a ribose or deoxyribose sugar covalently bound a base portion. The nucleosides are joined together by circumstance of the nucleosides includes a conditied ribofurance. At least one of the nucleosides includes a conditied ribofurance, and research agents a 2'-fluoro substituent. The carrier and research agents e.g. for the treatment of various viruses (e.g. AIDS), for modulating the production of proteins by an organism, ce.g. alteroselerosis, cancer), detecting the presence or consence of abnormal RNA molecules, or abnormal or inappropriate consence of abnormal RNA molecules, or abnormal or inappropriate consence of abnormal RNA molecules in organisms or cells, and for the expression of normal RNA molecules in organisms or cells, and for the compounds have improved stability to enzymatic degradation with various intracellular and extracellular nucleases, and improved ability to bind to a specific DNA or RNA with fidelity compared to wild-consense containing methylphosphonates, phosphorus-modified oligonucleotide of the invention targetine bursan caper.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S

                                                                                                                                                                                                                                                                                  The invention describes a method of preventing or treating tumour metastessis in an animal comprising administering to the animal an oligonucleotide 8-50 nucleotides in length, which is targeted to mRNA encoding human raf and capable of inhibiting raf expression. Also disclosed are raf oligonucleotides, nucleic acids, proteins and compositions used in the methods of the invention. The oligonucleotides have cytostatic and antiarteriosclerotic properties, are useful as Rafinhibitors and in antisense-therapy. The methods and compositions of the present invention are useful for preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumours. This sequence represents a human c-raf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumors, using antisense oligonucleotide modulation of human raf gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human c-raf kinase

                                                                           oligonuclectides comprising at least one modified 2'-deoxyfuranosyl group. The modified oligonuclectides are disclosed as being useful for modulating the production of a protein by an organism, and especially for treating a disease in an organism which is characterised by the undesired production of a protein. The oligonuclectides may be used to treat diseases caused by viruses or other agents. The oligonuclectides may also be used for disgnostic methods for detecting the presence or absence of abnormal RNA molecules, or for detecting the inappropriate expression of normal RNA molecules in an organism or cell. Oligonuclectides of the invention that selectively bind RNA molecules are research as research reagents. The new oligonuclectides are nuclease resistant and hybridise to RNA or DNA targets with high strength and specificity. The present sequence represents a human c-raf antisense oligonuclectide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            13-AUG-1990;

                                                                                                                                                                                                                                                                                                                  The invention relates to an oligonucleotide 8-50 nucleotides in length which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a protein kinase playing a regulatory role in signal transduction, regulating cell proliferation and has been implicated in lung carcinoma), and which is capable of inhibiting raf expression. Also included is a composition comprising the oligonucleotide and a pharmaceutically acceptable carrier. The antisense oligonucleotide is useful for inhibiting the expression of human raf in human cells or tissues, by contacting the human cells or tissues with the oligo. Is also is useful for treating or preventing a disease or condition associated with the expression of raf by administering it in combination with a chemotherapeutic agent to a human or cells of the human, where the expression of raf is abnormal expression, and the condition is a hyperproliferative condition such as cancer, angiogenesis or
                                                                                                                            neovascularisation (preferably ocular angiogenesis or neovascularisation). The oligo. is also useful for inhibiting hyperproliferation of cells. The oligos are also useful as tools, for example for detecting and determining the role of raf expression in various cell functions and physiological processes and conditions and for diagnosing conditions associated with raf expression and for research
                                                                   diagnosing conditions assucrated manner ourposes. The present sequence is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; 88; antisense; c-raf; a-raf; b-raf; protein kinase; cancer; signal transduction; cell proliferation; lung carcinoma; cytostatic; antisense gene therapy; chemotherapeutic agent; angiogenesis; hyperproliferative condition; neovascularisation; ocular angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense oligonucleotide which is targeted to mRNA encoding human raf and which is capable of inhibiting raf expression, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       05-SEP-2003

to the human or murine acyl coenzyme A cholesterol acyltransferase-1 gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human or murine acyl coenzyme A cholesterol acyltransferase-1 RNA, and were analysed for their effect on acyl coenzyme A cholesterol acyltransferase-1 mRNA levels by quantitative real-time PCR. Acyl coenzyme A cholesterol acyltransferase (ACAT) enzymes catalyse the synthesis of cholesterol esters from free cholesterol and fatty acyl-COA, and are also involved in regulating the concentration of cellular free sterols. The murine acyl coenzyme A

                                           polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polynucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cholesterol acyltransferase-1 gene is located on chromosome 1. The oligonucleotides of the invention are useful for the prevention and treatment of conditions associated with acyl coenzyme A cholesterol acyltransferase-1, such as disorders involving abnormal lipid or cholesterol metabolism, e.g., atherosclerosis or cardiovascular dise They are also useful in research and disagnostics for modulating the expression of acyl coenzyme A cholesterol acyltransferase-1
                                                                                                                                                                                                                     The invention relates to a novel polynuclectide isolated and purified from a human gene having any one of 935 fully defined sequences as girin specification, or a sequence having a base substitution. The invent further relates to an oligonuclectide containing single nuclectide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human; single nucleotide polymorphism; microarray; side effect; ss;
